HOW TO CHOOSE YOUR WING

Less stiffness will provide more comfort:

- Easy pumping
- Forgiving and accessible
- Not too demanding physically

A softer wing will perform better on its low end / in lighter winds

More stiffness will provide better performances:

- Increased upwind angle
- Unmatched speed
- Better pop and hangtime.

A stiffer wing will perform better on its high end / in stronger winds.

Glossary

C

Carving

This movement is similar to carving in snowboarding or skiing, where the rider leans their body and equipment into the turn to maintain stability and control the trajectory, while preserving speed.

- + = Speed maintained at the turn exit
- = Loss of speed in the turn

D

Downwind

Performance and comfort when downwinding

- + = Excellent for downwinding
- = Not suitable for downwinding

E

Efficiency

The hydrodynamic efficiency of a foil mast measures its ability to generate the minimum possible drag (resistance to forward motion). The thicker the mast, the higher the profile drag. At high speed, this drag can become a major limiting factor – a mast that is too thick significantly slows down performance.

F

Freefly

Ability to keep the wing in a neutral, stable, and balanced position for effortless freefly.

- + = Very stable, easy to maintain in neutral position
- = Unstable wing

Freeride

Versatility of the board

- + = Versatile
- = Specialized

G

Glide

Helps maintain a smooth and continuous trajectory by adjusting the hydrofoil’s lift and minimizing disturbances.

- + = Glide capability
- = No glide

H

Hangtime

Duration the rider stays in the air during a jump

- + = Wing provides strong lift
- = Short hangtime

M

Maneuvrability

Ability to respond to the rider’s movements while providing smooth and precise control.

- + = Very agile, responds quickly and easily to the rider’s movements
- = Board difficult to handle in the air, not very responsive

O

Overpower

Ability of the wing to lift you out

- + = a lot of overpower
- = no overpower

P

Pitch

Involves a rocking motion of the hydrofoil forward or backward, affecting the board’s lift and stability.

- + = Free in pitch
- = Locked in pitch

Pitch stability

Ability of the board to remain stable front/back in flight.

- + = Very stable, predictable in flight
- = Board unstable front/back

Pivot

Used to quickly change direction by rotating the hydrofoil around its vertical axis, allowing adjustment of your position on the water or responding to changing conditions.

- + = Free in pivot / flat slide
- = Locked in pivot

R

Roll

Allows you to adjust the board’s angle relative to the water surface by rotating the hydrofoil around its longitudinal axis.

- + = More freedom in rail-to-rail
- = Stable / locked in roll

Glossary

S

Speed

Ability of the wing to generate speed efficiently.
+ = Very fast, easy acceleration
- = Slow, hard to accelerate

Speed Max.

This is the maximum speed a foil can reach before plateauing.

+ = Good high-speed range
- = Poor high-speed range

Speed Min.

This is the minimum speed, below which the foil stalls.

+ = Good low-speed range
- = Stalls too quickly

Stiffness

Ability to resist bending and twisting with minimal deformation (stiffness).
Better energy transfer during pumping accelerations and turns.

T

Take Off Beginner

Ease for a beginner to get up and go
+ = Very easy and stable, ideal for a beginner
- = Very difficult for a beginner to get up

Take Off Confirmed

Ease of a confirmed rider to get up and go
+ = Very easy and reliable for experienced riders
- = Unstable, requires effort even for experienced riders

U

Upwind

Ability of the wing to go upwind effortlessly
+ = Goes efficiently upwind
- = Requires rider input

W

Waves

Ability of the board to surf and provide control in the waves
+ = Excellent for surfing
- = Not suitable for surfing

Windrange

Ability of the wing to respond to commands and generate power
+ = Responds quickly and generates power
- = Slow to respond, difficult to command
